

Steps to fitting your LS17 Highway letter chute assembly into an existing brick wall

Step 1

Insert the grub screws into the threaded inserts of the letterplate then secure to the front sleeve using the 2 nylocs.

Step 2

Cut a hole 296mm high by 79mm wide at the required letterplate position as shown. Note the shape of the bottom cutout, the top should be cut perpendicular to the wall.

- **A = 16mm**, the height of the notch at the bottom of the cutout
- **B = 15mm**, the depth of the bottom notch
- **C = 280mm**, the distance from the top of the cutout to the top of the bottom notch
- **H = 296mm**, the overall height of the cutout
- **W = 79mm**, the overall width of the cutout

The angle of the slope is 28 degrees.

Step 3

Cut a hole in the rear face of the wall 283mm high by 87mm wide. The horizontal position of the rear cutout should be central to the front cutout. The vertical position is determined by the depth of the wall. For a standard double brick wall (215mm thick), the top of the rear hole will be approximately 107mm below the top of the front hole. For a standard cavity wall (280mm and shown in the illustration) the distance will be approximately 142mm.

- $A = 107\text{mm}$ for a standard double wall
- $A = 142\text{mm}$ for a standard double wall
- $H = 283\text{mm}$, the overall height of the cutout
- $W = 87\text{mm}$, the overall width of the cutout

The angle of the slopes is 28 degrees. The angle of the top of cutout should follow this as close as possible. The bottom cutout is not so critical and can be perpendicular to the wall.

Step 4

The rear chute has 2 sets of securing holes, the set required will depend on the depth of the wall. The diagram shows the set used for deeper walls. Place 2 nylon washers onto each of the 4 securing bolts and loosely screw into the securing holes. Position the washers as shown.

Step 5

Apply a small bead of clear silicon around the top and sides (not the bottom) of the flange on the rear section, then with the help of an assistant slide the front and rear sections together through the gaps in the wall. The securing bolts should locate in the adjustment slots of the front section. Ensure that there is a nylon washer either side of the adjustment slot as illustrated.

Step 6

Keeping the sections in place, tighten the 4 securing bolts.

Where the letterplate meets the wall, run a bead of clear silicon around the top and sides (not the bottom), also seal the internal joint by running a bead of silicon on the inside of the chute where the front and rear sections meet.
